The first part is the power optimizer, which handles DC to DC and optimizes or conditions the solar panel's power. There is one power optimizer per solar panel, and they keep the flow of energy equal. For example, with a standard string inverter, if one solar panel produces less energy, all the solar panels in that string will produce less energy.

A 12v 150 watt solar panel will produce about 18.3 volts and 8.2 amps under ideal sunlight conditions. (inc. 1kw/m² of sunlight intensity, no wind, and 25 o C temperature). The above values are based on DC (Direct current) output, but to run most of the household appliances we need AC (Alternating current)

For instance, a common single solar cell might produce about 0.5 volts; thus, a panel with 36 cells in series would have a nominal voltage of around 18 volts. However, the actual operating voltage can vary significantly based on factors like sunlight intensity and temperature.

PV panels vary in size and in the amount of electricity they can produce. Electricity-generating capacity for PV panels increases with the number of cells in the panel or in the surface area of the panel. PV panels can be connected in groups to form a PV array. A PV array can be composed of as few as two PV panels to hundreds of PV panels.
