What is Microgrid technology?

Microgrid technology refers to a small-scale power system with distributed energy resources. To effectively harness the potential of distributed generation, it's crucial to adopt a system where the associated loads and generation are treated as a single entity or a microgrid.

Why is microgrid important in Smart Grid development?

A microgrid is an important and necessary component of Smart Grid development. It is a small-scale power system with distributed energy resources. Realizing the distributed generation potential requires adopting a system where the associated loads and generation are considered as a subsystem or a microgrid.

What types of studies are conducted on microgrids?

The studies on microgrids are classified into two main topics: feasibility and economic studies, and control and optimization. The applications and types of microgrids are introduced first, and next, the objective of microgrid control is explained. Microgrid control falls under the categories of coordinated control and local control.

What is virtual microgrid testing?

Virtual microgrid testing in a closed loop simulation test ensures system functionality and control integrity before it arrives at your site. Multiple distributed generation sources -- including generators, solar, wind and energy storage -- can be integrated on a common grid structure.

What are the technical considerations of a microgrid?

The technical setup for a microgrid includes: current and historic levels of power supply reliability, current power generation mix, type of distribution grid, typical load profile, identification of critical loads versus controllable loads, and available space for a microgrid. (Figure 28) also considers environmental factors.

What are the features of a Microgrid Plus system?

A Microgrid Plus system includes a Microgrid Plus Control System, 1 x 750 kWp Solar PV, a 1 MW/380 kWh PowerStore Battery, and 2 x 600 kW Diesel generators. It also has remote monitoring and a renewable energy installation capacity of 750 kW. The business model involves an up-front capital investment by the consumer and grid connection.
