What are microgrids & how do they work?

Microgrids are local power grids that can be operated independently of the main - and generally much bigger - electricity grid in an area. Microgrids can be used to power a single building, like a hospital or police station, or a collection of buildings, like an industrial park, university campus, military base or neighbourhood.

Can microgrids bring electricity to all?

Most generate their own power using renewable energy like wind and solar. In power outages when the main electricity grid fails, microgrids can keep going. They can also be used to provide power in remote areas. A nun in the Democratic Republic of Congo is showing the world how microgrids can bring electricity to all.

What is a microgrid (MG)?

The MG is a promising potential for a modernized electric infrastructure . The term "microgrid" refers to the concept of a small number of DERs connected to a single power subsystem. DERs include both renewable and /or conventional resources . The electric grid is no longer a one-way system from the 20th-century .

Are maritime power systems a commercial microgrid?

Maritime: Maritime power systems, such as those installed in ships, ferries, vessels, and other maritime devices, operate in islanded mode at sea and grid-connected mode at port. Therefore, maritime MGs are true commercial microgrids that are affordable and have a prospective market.

Who owns a microgrid?

According to Navigant Research , the majority of grid-tied microgrids today are owned and financed by facility owners, especially in the campus/institutional category. It is important to recognize that microgrids, especially community microgrids, can utilize the existing distribution system infrastructure, radically reducing their costs.

What happens if a microgrid goes down?

Microgrids can provide power to important facilities and communities using their distributed generation assets when the main grid goes down. Because electrical grids are run near critical capacity, a seemingly innocuous problem in a small part of the system can lead to a domino effect that takes down an entire electrical grid .
