Can decentralized energy systems improve access to electricity in refugee settlements?

This work sheds light on the potential of decentralized energy systems to offer a fast, reliable and sustainable way to increase access to electricity in refugee settlements in SSA.

Can solar power reduce poverty?

A recent study shows that solar photovoltaic systems are more affordable to no less than 36% of the unelectrified populations and can boost the efforts to reduce poverty: " Mapping of affordability levels for photovoltaic-based electricity generation in the solar belt of sub-Saharan Africa, East Asia and South Asia "

Could solar power help refugees in Sub-Saharan Africa?

Deploying solar mini-grids across the nearly 300 refugee settlements in sub-Saharan Africa would deliver clean and reliable energy to 5 million people while avoiding the emissions of 2.86Mt CO₂ over 20 years, compared to the use of diesel generators.

How can a solar-powered mini-grid help refugees and host communities?

As a recent example, the presence of a solar-powered mini-grid in the Kalobeyei settlement (Kenya) increased the number of informal businesses run by refugees and host communities, with cooled beverages vendors, phone charging spots, hair-dressers and many other enterprises sprouting.

What is the electricity access rate for refugees in SSA?

More generally, according to the latest 'Tracking SDG 7: Energy Progress Report' 24 the electricity access rates for refugees in SSA are between 1% and 25%, depending on the hosting country. The optimal capacity of the solar PV and battery storage system for Moyo is computed at 530 kWp and 1,550 kWh, respectively.

What are the benefits of clean electricity access in refugee settlements?

In addition to environmental benefits, clean electricity access in refugee settlements is associated with improved health, water, education services, security, gender-based violence reduction and opportunities for income-generating activities 6.

The efficiency of energy conversion depends mainly on the PV panels that generate power. The practical systems have low overall efficiency. This is the result of the cascaded product of several efficiencies, as the energy is converted from the sun through the PV array, the regulators, the battery, cabling and through an inverter to supply the ac load [10], [11].

People use solar panels or, as they are also known, solar modules to produce electricity and in short, it happens when light particles - photons - are collected from the sun's light by solar panels (which consist of solar cells), that forces some electrons in solar cells to separate from its atoms and move, producing electricity that people
