What is the working principle of a polycrystalline solar panel?

The working principle of a polycrystalline solar panel is as follows: 1. Sunlight photons hit the PN junction, which is a junction between P-type and N-type materials. 2. The junction gives energy to the electrons, allowing them to flow as an electric current. 3. The metal contacts in the cells collect the electricity.

What are monocrystalline solar panels?

Monocrystalline solar panels, also known as mono panels, are made from photovoltaic cells. Each cell is a slice of a single crystal of silicon that is grown in a lab into a cylindrical ingot. The ingot is then sliced into thin discs, or wafers, to form cells.
