For the underground solar energy storage system, the groundwater flow can increase the heat loss due to self-discharge [33], while for the latter it facilitates the heat restoration [34]. In this study, only the thermal conduction was considered for the heat transfer through the soil. This assumption is reasonable considering that the dry soil ...

In the current energy transition towards a sustainable economy, large-scale energy storage systems are required to increase the integration of intermittent renewable energies, such as wind and solar photovoltaics. Underground energy storage systems with low environmental impacts using disused subsurface space may be an alternative to provide ...

Compared to the laminar flow, the turbulent flow contributes more to the underground solar energy storage as the soil is more saturated. This suggests a technique to minimise the electricity consumption by the system and thus optimise its performance through regulating the flowrate. In addition, a mathematical model of the coupled energy pile ...

energy storage can, for example, be implemented in heating networks in the form of Underground Thermal Energy Storage (UTES) to support the use of surplus heat from industry and the implementation of renewable heat sources such as bio-Combined Heat and Power (CHP), geothermal, and solar energy.

Underground energy storage and geothermal applications are applicable to closed underground mines. Usually, UPHES and geothermal applications are proposed at closed coal mines, and CAES plants also are analyzed in abandoned salt mines. ... Moreover, the proposed systems can be combined renewable energy storage, such as wind and solar power ...

These systems store thermal energy from natural heat and/or cold in air, soil and water, solar energy, and waste heat from any mechanical process for seasonal purposes. ... The basic types of underground thermal energy storage systems under the definition of this book can be divided into two groups (Sanner 2001; Novo et al. 2010):
